

For the camera activity I check to see if I have permission to use the camera on the phone. If I don't then I request permission. I then send an intent to camera to turn on and send data back and have the user take a picture and send that data back to the activity which displays the bitmap on the image view.

For the EMI calculator I have three seekbars that determine the three variables of the EMI equation. As the player presses the and moves the seekbar the value is recorded into these variables. The player then presses the calculate button which puts the variables into the equation and prints out the answer in a text view.

The generate person has the user enter information that is sent into a Person class which is then sent through parcelably to the main activity which puts it into an array list. The array list is then passed through an intent to the display person activity when the user presses the button. That array is then displayed on the text view.

For the calendar I have a text view display the currently selected date on the calendar.

For the webpage I try and load a website through a web view. I give the permissions to use the internet and check to see if the permissions are given and if not I try to ask for them.
